ENVIRONMENTAL MANAGEMENT SYSTEM

ISO 14001:2015

Environmental Management

ISO 14001:2015

Responsible e-waste, battery & energy management

Environmental policy, procedures, risk register & audit checklist

1. Environmental Context & Scope

SYLTRA is committed to identifying the internal and external factors affecting its ability to deliver automation, installation, and maintenance services that are safe, sustainable, and environmentally responsible.

External Issues

Rapid technological development in PLCs, local electrical and environmental regulations, and volatility in global supply-chain pricing for electronic components.

Internal Issues

Engineering and technical staff competency, stability of approved software, and availability of safety equipment and sensitive inspection/measurement devices.

2. Environmental Policy

As part of its Integrated Management System, SYLTRA's management commits to:

- Protecting the environment and preventing pollution through the sound management of electronic waste, spent batteries, and reduced energy consumption.
- Complying with all applicable environmental legislation and regulatory requirements.
- Continually improving environmental performance and involving employees in decisions related to waste handling and resource use.

3. Procedure — Electronic & Environmental Waste Management

Objective: Ensure the safe and environmentally sound disposal of waste generated during maintenance operations and control-panel replacement.

- Sort waste at the work site and in company stores into: hazardous electronic waste, cabling and connectors, and cardboard/plastic.
- Store depleted batteries (from UPS units) and damaged capacitors in sealed, leak-resistant containers.
- Contract exclusively with officially licensed recycling operators, certified by the environmental authority, for the transport and destruction of these materials.

4. Environmental Risk Assessment

Extract of the HSE Risk Assessment Matrix relevant to environmental aspects of SYLTRA's field operations:

Process / Activity	Potential Hazard	Environmental Impact	P	S	Level	Required Controls
Maintenance & upgrade of legacy systems	Uncontrolled disposal of PLC cards and batteries	Soil and groundwater contamination by heavy metals	3	4	12 (High)	Collect damaged cards in dedicated containers and hand over to certified e-waste recyclers.

5. Environmental Records

Key output records maintained under this scope: the **E-Waste Log** (tracking quantities, categories, and collection dates of electronic waste by site), the **Disposal Certificates** issued by licensed recyclers for each consignment, and the **Environmental Aspect Register** documenting significant environmental aspects and impacts tied to installation and

maintenance activities.

6. Relevant Internal Audit Checkpoints (ISO 14001:2015)

Clause	Audit Requirement	Verification Method & Evidence	Conforms?
Clause 6: Planning	Have environmental objectives been defined (e.g. 100% recycling of panel waste)?	Inspect the "Quality, Safety & Environmental Objectives" document for the current year.	
Clause 8: Operation	Are hazardous-waste handling and disposal controls consistently applied on site?	Review the E-Waste Log and Disposal Certificates against completed projects.	
Clause 9: Performance Evaluation	Is environmental performance measured alongside customer satisfaction?	Inspect quarterly energy-consumption and waste-tracking records.
